## Corner Protectors for Reduced Thickness Porcelain

Corner Protectors from RTC Products are designed to slide over the edge of material from 3 mm-6 mm in thickness. Made of plastic, they help to absorb shock and protect against chipping when moving reduced thickness porcelain tile. This is the least expensive product available to help protect the material as well as the installer during the installation. See product features below.

**Security** – The corner is designed to grip the product surface without the need for additional fixing

**Heel** – The heel of the protector offers the product corner maximum impact protection

**Interior** – The interior surfaces of these corners are designed to channel impact energy away from the product edges and towards the center surface

**Edge** – The corner protector is suitable for beveled and non-uniform edges
